Ocean engineering poses many problems with violent surface flows and body interaction. Numerical modelling with particle methods in Lagrangian form has certain advantages over mesh based methods in that the particles naturally follow the extreme flow distortions which may include multi-phase interactions. This special issue solicits latest developments and applications on particle methods in this context. Smoothed Particle Hydrodynamics (SPH) in its various forms is perhaps most widely applied but there are many variations such as those based on the Meshless Local Petrov-Galerkin (MLPG) method and Particle Finite Element method which are also relevant.

**Instructions for submission**

Please click on “Submit Online” and login into Editorial Manager. Then click on “Submit New Manuscript”, select the article type (research article, review article or short communication) and enter the title of your article. In the next step (see screenshot below), click on “Additional Information” and indicate that you are submitting a “Special issue” article on “Particle Methods”.
